What are the risk factors for prostate cancer?

- Age: Risk increases after age 50.
- Family history: Having a father or brother with prostate cancer increases risk.

1. Digital rectal exam (DRE)
2. Prostate-specific antigen (PSA) blood test
3. Imaging tests (MRI, CT scans)

4. Prostate biopsy

What is a prostate biopsy?

A prostate biopsy involves taking small samples of prostate tissue to check for cancer cells. This is usually done using a needle guided by ultrasound.

What does a high PSA level indicate?

A high PSA level may indicate prostate cancer, but it can also result from other conditions such as benign prostatic hyperplasia (BPH) or prostatitis. Further testing is often required.

Treatment Options

What are the main treatment options for prostate cancer?

- Active surveillance
- Surgery (prostatectomy)
- Radiation therapy
- Hormone therapy
- Chemotherapy

What is active surveillance?

Active surveillance involves closely monitoring the cancer without immediate treatment. It is often recommended for low-risk, slow-growing prostate cancer.

What are the side effects of prostate cancer treatment?

- Erectile dysfunction
- Urinary incontinence
- Changes in sexual desire
- Fatigue

Can prostate cancer be cured?

Prostate cancer can often be cured, especially when detected early. The chance of cure depends on factors like the cancer's stage and grade.

Living with Prostate Cancer

How can one manage side effects of treatment?

- For erectile dysfunction: Medications, vacuum pumps, or penile implants may help.
- For urinary incontinence: Pelvic floor exercises and medications can be beneficial.
- For fatigue: Regular exercise and a balanced diet may alleviate symptoms.

What lifestyle changes can help during treatment?

- Maintain a healthy diet rich in fruits, vegetables, and whole grains.

- Maintain a healthy weight.
- Exercise regularly.
- Eat a well-balanced diet.
- Limit red meat and dairy intake.

What role does diet play in prostate cancer prevention?

Some studies suggest that diets high in fruits, vegetables, and omega-3 fatty acids may lower the risk of prostate cancer, while diets high in saturated fat may increase it.
