Sample Questions and Answers

1. Question: What is the definition of a Bessel function of the first kind, $J_n(x)$?

- Answer: The Bessel function of the first kind, $J_n(x)$, is defined as the solution to Bessel's differential equation that is finite at the origin ($x=0$). It can be expressed as a power series:

$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{2k+n}$$

2. Question: Evaluate $J_0(2)$ using its series definition.

- Answer: Using the series definition:

$$J_0(2) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(k+1)} \left(1\right)^{2k} = \frac{1}{2} \sum_{k=0}^{\infty} \frac{(-1)^k}{(k!)^2} \cdot 2^{2k}$$

This sum can be approximated numerically or calculated using mathematical software.

3. Question: What are the orthogonality properties of Legendre polynomials?

- Answer: Legendre polynomials, $P_n(x)$, satisfy the orthogonality condition:

$$\int_{-1}^1 P_n(x) P_m(x) dx = 0 \quad \text{for } n \neq m$$

\]

This property is crucial in solving boundary value problems in physics.

4. Question: Solve the equation $y'' + 4y = 0$, and express the solution in terms of sine and cosine functions.

- Answer: The characteristic equation is $r^2 + 4 = 0$, leading to complex roots $r = \pm 2i$. The general solution is:

\[

$$y(x) = C_1 \cos(2x) + C_2 \sin(2x)$$

\]

where C_1 and C_2 are constants determined by initial conditions.

5. Question: Graph the function $y = J_1(x)$ for $0 \leq x \leq 10$.

- Answer: The graph of $J_1(x)$ exhibits oscillatory behavior, crossing the x-axis multiple times, which can be plotted using graphing software or a graphing calculator.

Conclusion

The **2 6 practice special functions answer key** serves as an invaluable tool for both students and educators in mastering the complexities of special functions.
