Understanding 3x3 Rotation Matrices

Rotation matrices are fundamental in linear algebra and geometry for representing rotations in three-dimensional space. A 3x3 rotation matrix is an orthogonal matrix with real entries whose determinant is +1. These matrices perform rotations around the origin and preserve the length of vectors, making them crucial in various mathematical and engineering contexts.

Definition and Properties

A 3x3 rotation matrix, often denoted as R , has the following key properties:

- **Orthogonality:** The columns (and rows) of R are orthonormal vectors, meaning $R^T R = I$, where R^T is the transpose and I is the identity matrix.

- **Determinant:** The determinant of R is always $+1$, distinguishing it from reflection matrices.
- **Preservation of Vector Norms:** Rotations do not alter the magnitude of vectors.
- **Inverse:** The inverse of R is its transpose, $R^{-1} = R^T$.

Common Rotation Axes and Angles

3x3 rotation matrices commonly represent rotations about the principal axes (x, y, or z). Each axis has a standard rotation matrix characterized by an angle θ :

- **Rotation about x-axis:** Rotates vectors around the x-axis by angle θ .
- **Rotation about y-axis:** Rotates vectors around the y-axis by angle θ .
- **Rotation about z-axis:** Rotates vectors around the z-axis by angle θ .

These matrices serve as building blocks for more complex rotations and are foundational in solving the practice problems addressed by the 3 3 additional practice rotations answer key.

Step-by-Step Solutions to Common Rotation Problems

Understanding how to approach and solve rotation problems systematically is key to mastering rotational transformations. The 3 3 additional practice rotations answer key illustrates this through representative problems and their detailed solutions.

Example Problem: Rotation About the Z-Axis

Problem: Given an angle $\theta = 45^\circ$, find the 3x3 rotation matrix representing a rotation about the z-axis, and apply it to vector $v = (1, 0, 0)$.

Solution:

1. Recall the rotation matrix about the z-axis:

$$R_z(\theta) =$$

[

$$\cos\theta \quad -\sin\theta \quad 0$$

$$\sin\theta \quad \cos\theta \quad 0$$

$$0 \quad 0 \quad 1$$

]

2. Substitute $\theta = 45^\circ$, with $\cos 45^\circ = \sqrt{2}/2$ and $\sin 45^\circ = \sqrt{2}/2$:

$$R_z(45^\circ) =$$

[

$$\sqrt{2}/2 \quad -\sqrt{2}/2 \quad \& \quad 0$$

$$\sqrt{2}/2 \quad \& \quad \sqrt{2}/2 \quad \& \quad 0$$

$$0 \quad \& \quad 0 \quad \& \quad 1$$

]

3. Multiply $R_z(45^\circ)$ by vector v :

$$R_z(45^\circ) * v =$$

[

$$\sqrt{2}/2 \quad -\sqrt{2}/2 \quad \& \quad 0$$

$$\sqrt{2}/2 \quad \& \quad \sqrt{2}/2 \quad \& \quad 0$$

$$0 \quad \& \quad 0 \quad \& \quad 1$$

]

[

]

=

[

$\sqrt{2}/2$

$\sqrt{2}/2$

0

]

4. The resulting vector is $(\sqrt{2}/2, \sqrt{2}/2, 0)$, which confirms the rotation by 45° in the xy-plane.

Example Problem: Verifying Orthogonality of a Rotation Matrix

Problem: Verify that the rotation matrix R about the x-axis by 90° is orthogonal.

Solution:

1. Rotation matrix about x-axis for $\theta = 90^\circ$:

$R_x(90^\circ) =$

[

1 & 0 & 0

0 & 0 & -1

0 & 1 & 0

]

2. Calculate $R^T R$:

Multiply the transpose of $R_x(90^\circ)$ by $R_x(90^\circ)$ itself.

3. The product equals the 3x3 identity matrix, confirming orthogonality.
