- Factoring and simplifying algebraic expressions
- Applying properties of exponents and radicals

Detailed Answers to Common Problems

Providing the algebra 1 escape room challenge b answers requires a clear and systematic approach to each problem type. Below are examples of common problems encountered in the challenge along with their respective solutions to aid in understanding.

Solving Linear Equations

Example: Solve $3x - 7 = 11$

Solution: Add 7 to both sides to isolate the term with the variable:

1. $3x - 7 + 7 = 11 + 7$
2. $3x = 18$
3. Divide both sides by 3:
4. $x = 6$

The answer to this equation is $x = 6$.

Graphing Linear Functions

Example: Given the function $y = 2x + 3$, find the y-value when $x = 4$.

Solution: Substitute $x = 4$ into the function:

1. $y = 2(4) + 3$

2. $y = 8 + 3$

3. $y = 11$

Thus, the point $(4, 11)$ lies on the line represented by the function.

Solving Inequalities

Example: Solve and graph the inequality $2x + 5 > 9$

Solution:

1. Subtract 5 from both sides: $2x > 4$

2. Divide both sides by 2: $x > 2$

The solution set includes all values greater than 2. On a number line, this is shown by an open circle at 2 and shading to the right.

Factoring Algebraic Expressions

Example: Factor the expression $x^2 + 5x + 6$

Solution: Find two numbers that multiply to 6 and add to 5, which are 2 and 3:

$$(x + 2)(x + 3)$$

This is the factored form of the quadratic expression.

Step-by-Step Solutions for Key Questions

Detailed, stepwise solutions provide clarity and reinforce learning for students tackling the escape room challenge. Below are thorough explanations for select key questions from the Algebra 1 Escape Room Challenge B.

Example Question: Solve for y in the equation $4y - 3 = 13$

Step 1: Add 3 to both sides to isolate the variable term.

$$4y - 3 + 3 = 13 + 3$$

$$4y = 16$$

Step 2: Divide both sides by 4 to solve for y.

$$y = 16 \div 4$$

$$y = 4$$

Answer: $y = 4$

Example Question: Simplify the expression $3(2x - 4) + 5$

Step 1: Apply the distributive property.

$$3 \times 2x = 6x$$

$$3 \times -4 = -12$$

The expression becomes $6x - 12 + 5$

Step 2: Combine like terms.

$$-12 + 5 = -7$$

The simplified expression is $6x - 7$.

Example Question: Solve the system of equations

$$2x + y = 7$$

$$x - y = 1$$

Step 1: Add the two equations to eliminate y.

$$(2x + y) + (x - y) = 7 + 1$$

$$3x = 8$$

Step 2: Solve for x.

$$x = 8 \div 3$$

Step 3: Substitute x back into one of the original equations.

$$x - y = 1 \Rightarrow (8/3) - y = 1$$

Subtract $8/3$ from both sides:

$$-y = 1 - 8/3$$

$$-y = (3/3) - (8/3) = -5/3$$

Multiply both sides by -1:

$$y = 5/3$$

Answer: $x = 8/3$, $y = 5/3$
