Functions and Their Properties

Understanding functions is central to algebra 2. Students explore different types of functions including linear, quadratic, polynomial, rational, exponential, and logarithmic functions. They learn to analyze function behavior, graph functions, and interpret domain and range. Emphasis is placed on function notation and the concept of inverse functions.

Polynomials and Factoring

Students extend their knowledge of polynomials by working with higher-degree expressions, performing operations such as addition, subtraction, multiplication, and division. Factoring techniques are expanded to include methods like grouping, synthetic division, and the use of the Rational Root Theorem.

Rational Expressions and Equations

The curriculum covers simplifying rational expressions, solving rational equations, and understanding asymptotic behavior of functions. Students learn to identify restrictions on variables and solve real-life problems involving rational expressions.

Complex Numbers and Quadratic Equations

Complex numbers are introduced to solve quadratic equations that have no real solutions. Students learn to perform arithmetic operations with complex numbers and represent them graphically on the complex plane.

Logarithms and Exponential Functions

Exponential growth and decay models are studied using exponential functions. Logarithmic functions are introduced as inverses of exponentials, and students learn properties of logarithms and how to solve logarithmic equations.

Sequences, Series, and Probability

The curriculum includes arithmetic and geometric sequences and series, including formulas for sums. Basic probability concepts are also integrated to develop students' statistical reasoning and data interpretation skills.
