Physiology content focuses on the functions and mechanisms of these structures in maintaining homeostasis and supporting life processes.

Skeletal System

The skeletal system section details the bones of the human body, their classification, and their roles in protection, support, and movement. Study guides explore bone anatomy, growth, and remodeling, as well as joint types and functions.

Muscular System

This section explains muscle tissue types, mechanisms of contraction, and the integration of muscles with the skeletal system to produce movement. It also covers muscle metabolism and neuromuscular coordination.

Nervous System

The nervous system topic includes the structure and function of neurons, neural pathways, and the central and peripheral nervous systems. It highlights sensory input, motor output, and regulatory functions.

Cardiovascular System

Study materials cover the anatomy of the heart, blood vessels, and blood components, along with physiological processes such as circulation, blood pressure regulation, and oxygen transport.

Respiratory System

This section explains the anatomy of the respiratory tract and the mechanics

of breathing, gas exchange, and respiratory regulation.

Other Systems

Additional sections include the digestive, urinary, endocrine, lymphatic, reproductive, and integumentary systems, each examined in terms of both anatomy and physiology.
