2. Blocking Strategy: Create a blocking structure that fits the geometry, ensuring that the mesh aligns with flow features.
3. Mesh Generation: Utilize the mesh generation tools to create the structured mesh based on the defined blocks.

Unstructured Mesh Generation

Unstructured meshes are more flexible and can accommodate complex geometries. The process involves:

1. Geometry Import: Import the geometry from a CAD software or create it within ICEM CFD.
2. Surface Mesh Generation: Generate a surface mesh that captures the details of the geometry.
3. Volume Mesh Generation: Convert the surface mesh into a volume mesh using the unstructured meshing tools.

Hybrid Mesh Generation

Hybrid meshes combine both structured and unstructured elements, allowing users to optimize mesh quality in different regions of the model. The steps include:

1. Defining Regions: Identify areas where structured or unstructured meshes are most appropriate.
2. Creating Blocks: Create blocks for the structured regions and define unstructured mesh parameters for other areas.
3. Mesh Generation: Generate the hybrid mesh, ensuring smooth transitions between structured and unstructured regions.
