Reviewing sample questions from the ap psych exam 2023 frq section provides insight into what students can expect and how to formulate strong responses.

Sample Question 1: Classical Conditioning

Describe the process of classical conditioning and provide an example of how it might explain a person's fear response.

Model Answer: Classical conditioning is a learning process in which a neutral stimulus becomes associated with an unconditioned stimulus to elicit a conditioned response. For example, if a person experiences a traumatic event involving dogs (unconditioned stimulus causing fear), they may develop a fear of dogs (conditioned response) when later encountering dogs (conditioned stimulus), even if no harm occurs.

Sample Question 2: Research Methods

Model Answer: The independent variable is the amount of sleep deprivation participants experience, as it is manipulated by the researcher. The dependent variable is memory recall performance, which is measured to assess the effect of sleep deprivation.

Sample Question 3: Social Psychology

Explain how conformity might influence an individual's behavior in a group setting.

Model Answer: Conformity occurs when individuals change their behavior or beliefs to align with group norms due to real or imagined social pressure. This influence can lead a person to adopt behaviors they might not otherwise choose in order to fit in or avoid rejection.
