Key system calls covered include `open()`, `read()`, `write()`, `close()`, and `ioctl()`.

File Operations and Management

The book explores file I/O in depth, discussing file descriptors, file positioning, and file permissions. It also covers advanced topics such as memory-mapped files, asynchronous I/O, and the use of standard

I/O libraries for buffered operations.

Process and Thread Management

Managing processes and threads is a core aspect of Linux programming. The beginning linux programming 5th edition breaks down concepts related to process creation, execution, termination, and synchronization, enabling programmers to write concurrent and efficient applications.

Process Creation and Control

This section describes how to create and manage processes using system calls such as `fork()`, `exec()`, `wait()`, and `exit()`. It explains process states, parent-child relationships, and signal handling to control process behavior.

Thread Programming Fundamentals

The book introduces POSIX threads (pthreads) as a method for achieving concurrency within a single process. Topics include thread creation, synchronization primitives like mutexes and condition variables, and thread-safe programming techniques.

Inter-Process Communication Techniques

Effective communication between processes is vital in many Linux applications. The beginning linux programming 5th edition covers a variety of inter-process communication (IPC) methods, presenting both classical and modern approaches.

Pipes and FIFOs

This subtopic explains anonymous and named pipes (FIFOs) as mechanisms for unidirectional data flow between processes. It covers creation, usage, and limitations of these IPC techniques.

Shared Memory and Message Queues

The book details the use of shared memory segments for fast data exchange and message queues for asynchronous communication. It discusses setup, synchronization, and cleanup procedures to ensure safe and efficient IPC.

Sockets for Network Communication

Sockets are introduced as a versatile IPC mechanism, particularly for networked applications. The book covers socket creation, binding, listening, and data transmission using TCP/IP protocols.
