Setting Up the Bellco Formula 2000

Proper setup of the Bellco Formula 2000 is vital for ensuring a successful dialysis session. Follow these steps to prepare the machine:

1. Check the Equipment: Ensure that all components are in good working condition, including the control panel, pumps, and dialyzer.
2. Prepare the Water Supply: Connect the machine to the water treatment system. Verify that the water quality meets the required standards.
3. Load the Dialyzer: Attach the dialyzer securely to the machine, ensuring that all connections are tight to prevent leaks.
4. Prime the System: Fill the blood and dialysate circuits with fluid to eliminate air bubbles. This step is critical to avoid air embolism during treatment.
5. Set Parameters: Input the necessary treatment parameters into the control panel, including blood flow rate, dialysate flow rate, and treatment time.

Operational Guidelines

Operating the Bellco Formula 2000 efficiently requires adherence to specific guidelines:

1. Monitoring Patient Parameters

Throughout the dialysis session, monitor the following parameters:

- Blood pressure
- Heart rate
- Blood flow rate
- Dialysate flow rate
- Dialysis adequacy (Kt/V)

2. Responding to Alarms

The Bellco Formula 2000 includes several alarms that signal potential issues. Common alarms and responses include:

- High Pressure Alarm: Check for clots in the dialyzer or kinks in the tubing.
- Low Blood Flow Alarm: Verify connections and ensure there are no blockages in the blood circuit.
- Conductivity Alarm: Assess the dialysate concentration and water quality.

3. Ending the Treatment

At the conclusion of the dialysis session, follow these steps:

1. Stop the Blood and Dialysate Pumps: Gradually reduce the flow rates to avoid shock to the patient.
2. Remove the Dialyzer: Carefully disconnect the dialyzer, ensuring minimal blood loss.
3. Dispose of Used Materials: Follow appropriate disposal protocols for used dialyzers and blood tubing.
