understanding of human biology. The curriculum is designed to progress logically from microscopic to macroscopic levels of organization to facilitate comprehensive learning.

Cell Structure and Function

This subtopic introduces the basic unit of life—the cell. Students learn about cellular organelles, membrane dynamics, and cellular processes such as mitosis and meiosis. Understanding cell physiology forms the basis for grasping more complex biological systems.

Tissues and Their Types

The course explores the four primary tissue types: epithelial, connective, muscle, and nervous tissue. Each tissue's structure, function, and location within the body are examined to highlight their roles in maintaining homeostasis.

The Integumentary System

Students study the skin, hair, nails, and associated glands. The integumentary system's functions, including protection, thermoregulation, and sensory reception, are analyzed in detail.

Skeletal System

This section covers bone anatomy, types of bones, bone physiology, and the skeletal framework's role in support and movement. Joints and their classifications are also a critical focus to understand mobility and stability.

Muscular System

The muscular system unit addresses muscle tissue types, muscle contraction mechanisms, and the integration of muscular and skeletal systems to produce movement.

Nervous System

Students examine the organization of the nervous system, including the central and peripheral nervous systems, neuron structure, and neurophysiology. The nervous system's role in controlling and coordinating body functions is emphasized.
