Types of Experiments

Several experiments can be conducted using candy corn, each focusing on different scientific concepts. Below are some popular experiments that can be included in the candy corn experiment worksheet.

1. Measurement and Comparison

In this experiment, students will measure the dimensions of candy corn pieces and compare their findings with peers.

- Objective: To understand measurement and comparison.
- Procedure:
 1. Measure the height, width, and length of several pieces of candy corn using a ruler.
 2. Record the measurements in the data collection sheet.
 3. Calculate the average size of the candy corn pieces.
 4. Discuss the findings as a class, comparing measurements among groups.

2. Candy Corn Sorting and Classification

This activity allows students to sort candy corn by color or size, promoting critical thinking and classification skills.

- Objective: To practice sorting and classification.
- Procedure:
 1. Provide different containers for sorting.
 2. Ask students to sort the candy corn by color or size.
 3. Record the number of pieces in each category.
 4. Create a bar graph to visually represent the data.

3. Density Experiment

In this experiment, students will explore the concept of density by comparing candy corn to other liquids.

- Objective: To understand the concept of density.
- Procedure:
 1. Prepare different liquids such as water, corn syrup, and oil.
 2. Drop candy corn into each liquid and observe what happens.
 3. Record the results, noting how many pieces float or sink in each liquid.
 4. Discuss why the candy corn behaves differently in various liquids, introducing the concept of density.

4. Candy Corn Estimation Challenge

This activity encourages students to practice estimation skills while adding a competitive element.

- Objective: To improve estimation and rounding skills.
- Procedure:
 1. Fill a container with candy corn and ask students to estimate how many pieces it contains.
 2. After collecting estimates, count the actual number of pieces.
 3. Discuss the differences between estimates and actual counts.
 4. Have students reflect on strategies for making better estimates.

5. Graphing Results

After conducting experiments, students can learn to graph their results, reinforcing math and data analysis skills.

- Objective: To practice data representation through graphing.
- Procedure:
 1. After completing the experiments, have students compile their data.
 2. Using graph paper, students should create bar graphs or line graphs to represent their findings.
 3. Present graphs to the class, discussing trends and patterns observed in the data.
