Common Questions and Solutions in the Charge Launcher Gizmo

The charge launcher gizmo answer key addresses frequently encountered questions related to charge interactions, force calculations, and projectile motion of charged particles. This section outlines typical problems and their solutions.

Calculating Electric Force Between Charges

One common task is determining the magnitude and direction of the electric force between the launched charge and a target charge. Using Coulomb's law, the answer key provides stepwise calculations:

- Identify the magnitudes of the charges involved
- Measure the distance separating the charges
- Apply the formula $F = k * |q_1 * q_2| / r^2$, where k is Coulomb's constant
- Determine the direction based on charge signs (attraction or repulsion)

Analyzing Trajectory Changes Due to Electric Forces

The answer key explains how the electric force influences the path of the launched particle, including changes in velocity and acceleration, and predicts landing positions accurately.

Energy Conservation in the System

Problems involving kinetic and potential energy transformations are also addressed, showing how electrical potential energy converts to kinetic energy during particle motion.
