Common SQL Queries and Solutions

Here are some common SQL queries learners might encounter in the course, along with their solutions:

1. Selecting Data from a Table

```
```sql
SELECT FROM employees;
```
```

This query retrieves all records from the "employees" table.

2. Filtering Data

```
```sql
SELECT FROM employees WHERE department = 'Sales';
```
```

This query returns records of employees who work in the Sales department.

3. Aggregating Data

```
```sql
SELECT COUNT() FROM employees WHERE status = 'Active';
```
```

This query counts the number of active employees.

4. Joining Tables

```
```sql
SELECT a.employee_id, a.name, b.department_name
FROM employees a
INNER JOIN departments b ON a.department_id = b.id;
```
```

This query combines employee data with their respective department names.
