Astrological Foundations of the Age of Aquarius

The dawning of the Age of Aquarius is rooted deeply in the principles of astrology, particularly the concept of the precession of the equinoxes. This astronomical phenomenon causes the position of the sun during the vernal equinox to shift slowly backward through the zodiac constellations over approximately 26,000 years. Each “age” corresponds to the sun’s alignment with a specific zodiac sign during the spring equinox, lasting roughly 2,150 years. The Age of Aquarius follows the Age of Pisces, which is often associated with religious and spiritual transformation.

Precession of the Equinoxes Explained

The Earth’s axial wobble causes the equinox points to precess or move gradually along the ecliptic plane. This movement results in the sun rising in different constellations during the spring equinox over millennia, defining astrological ages. The Age of Aquarius is identified when the sun aligns with the Aquarius constellation at the vernal equinox,

signifying a new era.

Determining the Start of the Age

Astrologers debate the exact beginning of the Age of Aquarius due to varying definitions of constellation boundaries and astronomical calculations. Estimates range from the 20th to the 24th century, but many agree that the transition is currently underway or imminent. This uncertainty contributes to diverse interpretations of what the dawning signifies.
